## F-statistic: 1209 on 3 and 12861 DF,  p-value: < 2.2e-16
```

Sale Price vs. Square Foot Lot

- $R^2 = 0.01435$
- Adjusted $R^2 = 0.01428$ These R^2 values suggest that the square footage of a lot accounts for approximately 1.4% of the variation in sales price.

Sale Price vs. Square Foot Lot + Year Built + Sale Year + Bathrooms + Bedrooms

- $R^2 = 0.1597$
- Adjusted $R^2 = 0.1593$

These R^2 values suggest that the predictors used account for approximately 16% of the variation in sales price. This is a substantial increase over the 1.4% predicted by just the square footage and indicates that this model is a better fit for predicting the sale price of a home.

Beta Values

```
##
## Call:
## lm(formula = sale_price ~ sq_ft_lot + year_built + square_feet_total_living,
##     data = housing_data)
##
## Standardized Coefficients::
##               (Intercept)                sq_ft_lot                year_built
##               0.000000000                0.04116294                0.12347342
## square_feet_total_living
##               0.40711553
```

- $\text{sq_ft_lot} = 0.12$
- $\text{year_built} = 0.17$
- $\text{sale_year} = 0.04$
- $\text{bath_total} = 0.23$
- $\text{bedrooms} = 0.10$

These standardized beta values represent the impact that a one standard deviation change in the respective variable will have on the sale price. For example an increase of one standard deviation in square footage will increase sale price by 0.11 standard deviations. If everything else is held constant.

The standardized beta values also show the relative importance of each variable. Square footage and number of bedrooms can be said to have a similar impact, where number of bathrooms has a significantly larger impact on the sale price.

Confidence Intervals

```
##               2.5 %               97.5 %
## (Intercept)    -6.311551e+06  -4.782253e+06
## sq_ft_lot       1.779547e-01   4.067827e-01
## year_built      2.513176e+03   3.285875e+03
## square_feet_total_living 1.594730e+02  1.731737e+02
```

These confidence intervals show the range of where the possible beta values may lay with a 95% confidence level. The smaller the range the more likely our models beta value is representative of the greater population. The fact that none of the confidence intervals cross zero indicates that each factor listed is significant.

Analysis of Variance

```
## Analysis of Variance Table
##
## Model 1: sale_price ~ sq_ft_lot
## Model 2: sale_price ~ sq_ft_lot + year_built + square_feet_total_living
##   Res.Df      RSS Df Sum of Sq   F    Pr(>F)
## 1  12863 2.0734e+15
## 2  12861 1.6409e+15  2 4.3252e+14 1695 < 2.2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

The additional variable made a significant increase in the models accuracy since there is an F ratio of 556 with a $P < 0.001$.

```

There are 298 rows which could be classified as outliers however all except one have a cooks distance < 1 so they are likely not influencing the model. The one row which is providing influence and is an outlier is a home sold on appears to have sold for \$270,000 but has 23 bathrooms and has a lot size of 89734 square feet.

Assumption of Independence

```
## Warning: package 'car' was built under R version 4.1.3
```

```
## Loading required package: carData
```

```
## Warning: package 'carData' was built under R version 4.1.3
```

```
## lag Autocorrelation D-W Statistic p-value
## 1 0.7197493 0.5604916 0
## Alternative hypothesis: rho != 0
```

Because the D-W Statistic is less than 1 and the p value is less than 0.05 it can be assumed that there is autocorrelation in the variables in the model.

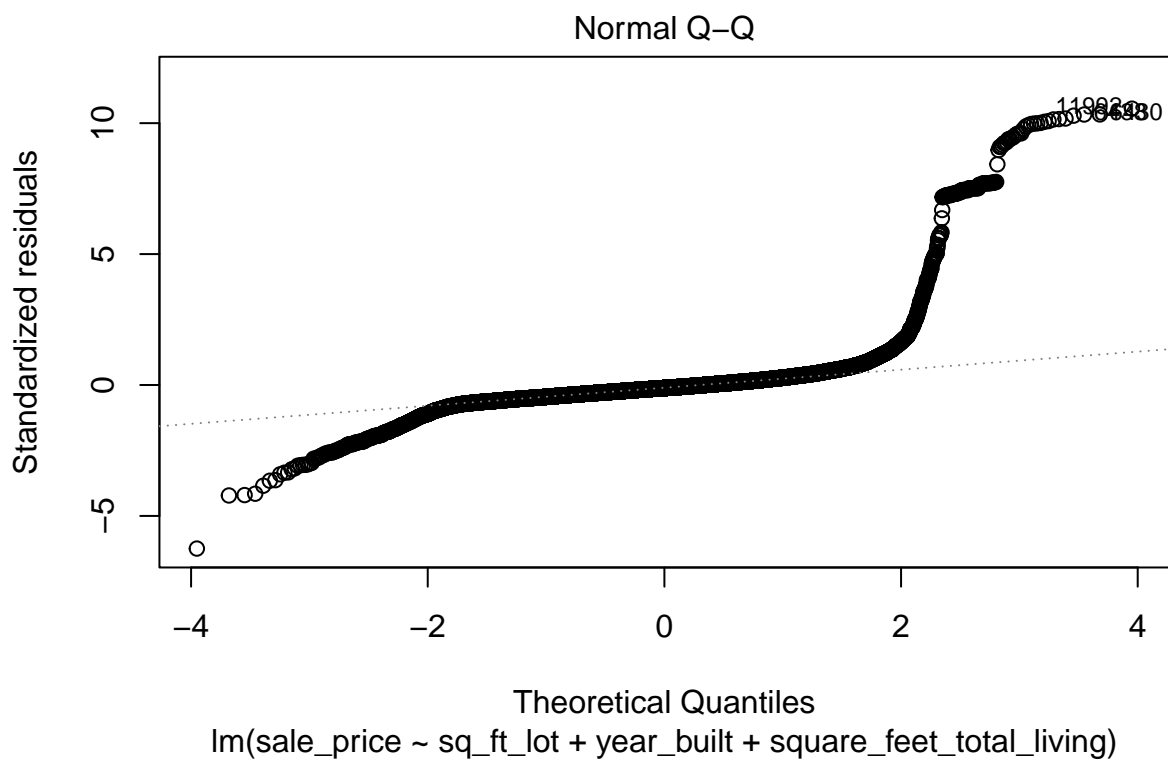

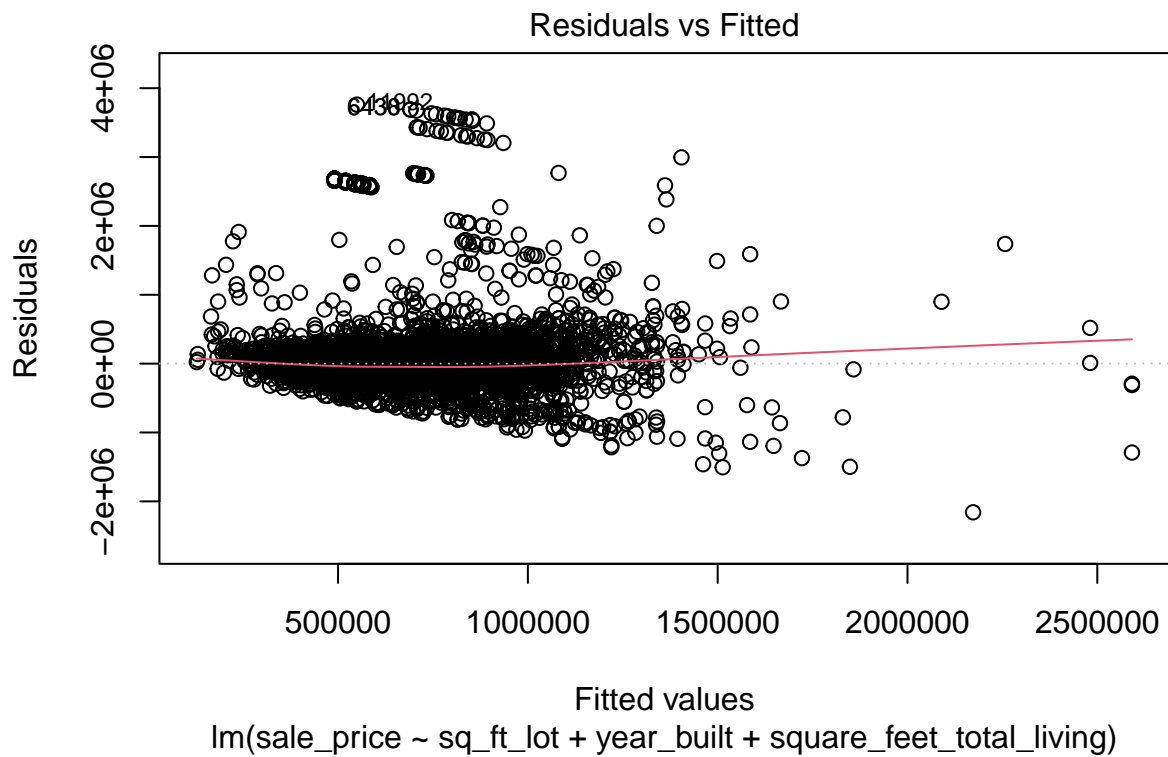

Assumption of No Multicollinearity

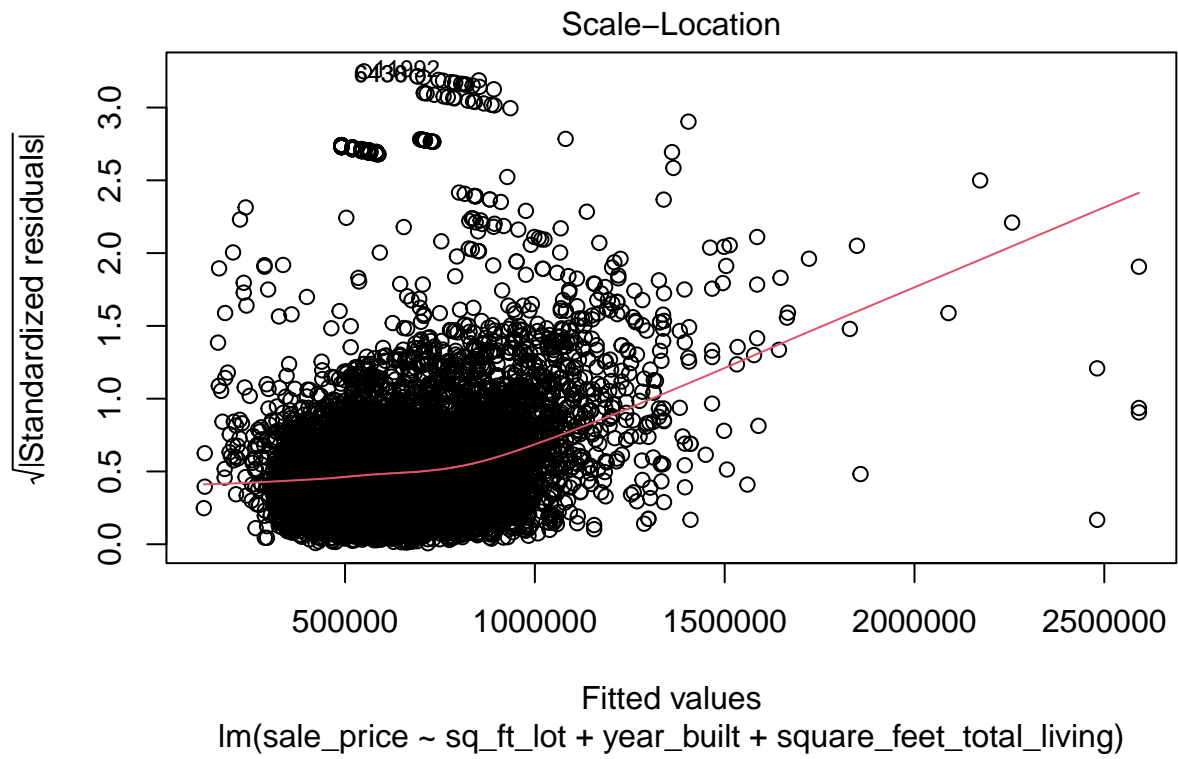

```
##          sq_ft_lot          year_built square_feet_total_living
##          1.113505          1.161545          1.206527
```

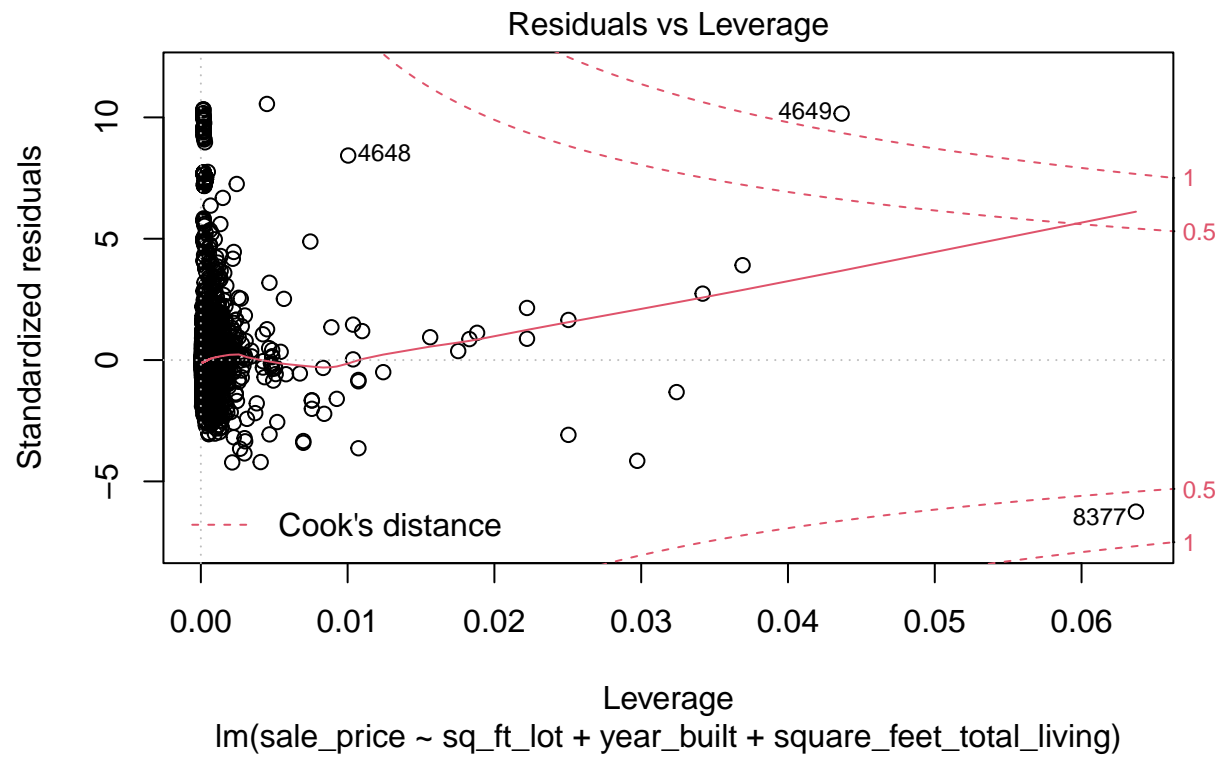

```
## [1] 1.160526
```

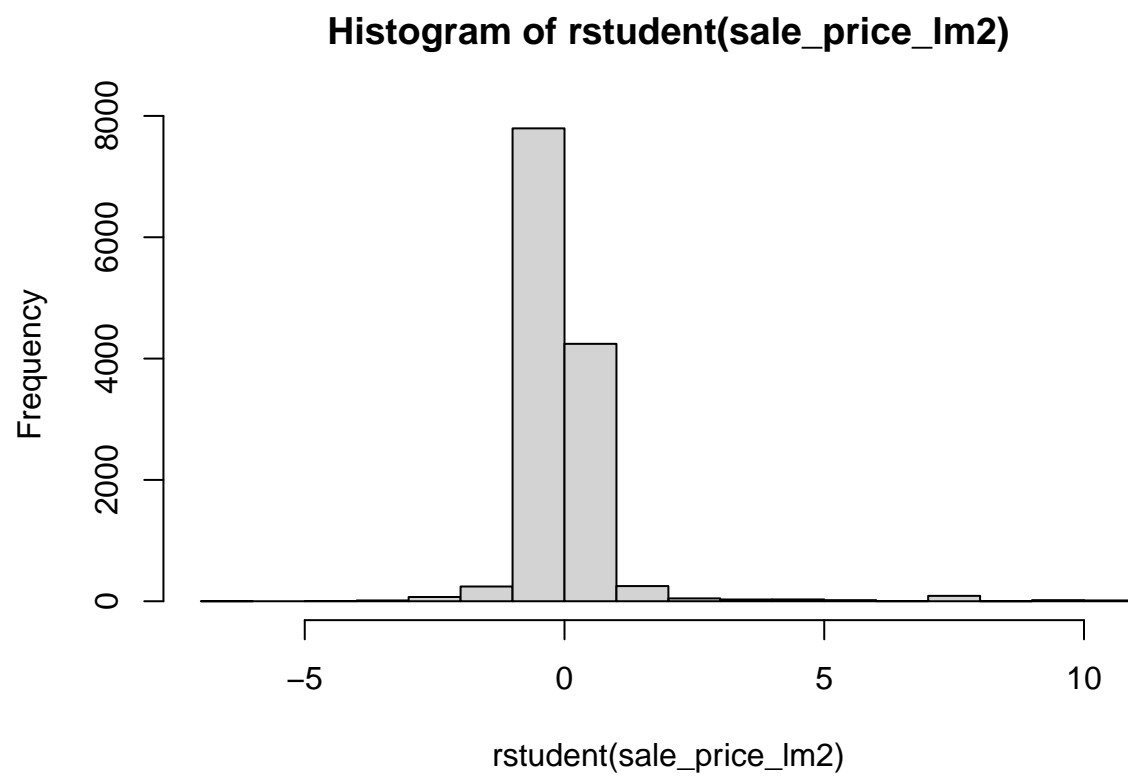

```
##          sq_ft_lot          year_built square_feet_total_living
##          0.8980655          0.8609220          0.8288253
```

The largest VIF is not greater than 10 and the average VIF is not substantially greater than 1. Additionally none of the tolerances are less than 0.2. With all of this information it can be concluded there is no multicollinearity between the variables used in the model.

The
