```r
# Assignment: ASSIGNMENT 1
# Name: Smitshoek, Stephen
# Date: 2022-03-23

## Create a numeric vector with the values of 3, 2, 1 using the `c()`
function
## Assign the value to a variable named `num_vector`
## Print the vector
num_vector <- c(3, 2, 1)
num_vector

## Create a character vector with the values of "three", "two", "one" "using
the `c()` function
## Assign the value to a variable named `char_vector`
## Print the vector
char_vector <- c("three", "two", "one")
char_vector

## Create a vector called `week1_sleep` representing how many hours slept
each night of the week
## Use the values 6.1, 8.8, 7.7, 6.4, 6.2, 6.9, 6.6
week1_sleep <- c(6.1, 8.8, 7.7, 6.4, 6.2, 6.9, 6.6)

## Display the amount of sleep on Tuesday of week 1 by selecting the variable
index
week1_sleep[3]

## Create a vector called `week1_sleep_weekdays`
## Assign the weekday values using indice slicing
week1_sleep_weekdays <- week1_sleep[2:6]

## Add the total hours slept in week one using the `sum` function
## Assign the value to variable `total_sleep_week1`
total_sleep_week1 <- sum(week1_sleep)

## Create a vector called `week2_sleep` representing how many hours slept
each night of the week
## Use the values 7.1, 7.4, 7.9, 6.5, 8.1, 8.2, 8.9
week2_sleep <- c(7.1, 7.4, 7.9, 6.5, 8.1, 8.2, 8.9)

## Add the total hours slept in week two using the sum function
## Assign the value to variable `total_sleep_week2`
total_sleep_week2 <- sum(week2_sleep)

## Determine if the total sleep in week 1 is less than week 2 by using the <
operator
total_sleep_week1 < total_sleep_week2

## Calculate the mean hours slept in week 1 using the `mean()` function
mean(week1_sleep)

## Create a vector called `days` containing the days of the week.
## Start with Sunday and end with Saturday
days <- c("Sunday", "Monday", "Tuesday", "Wednesday", "Thursday", "Friday",
"Saturday")
```

```r
## Assign the names of each day to `week1_sleep` and `week2_sleep` using the
`names` function and `days` vector
names(week1_sleep) <- days
names(week2_sleep) <- days

## Display the amount of sleep on Tuesday of week 1 by selecting the variable
name
week1_sleep["Tuesday"]

## Create vector called weekdays from the days vector
weekdays <- days[2:6]

## Create vector called weekends containing Sunday and Saturday
weekends <- days[c(1,7)]

## Calculate the mean about sleep on weekdays for each week
## Assign the values to weekdays1_mean and weekdays2_mean
weekdays1_mean <- mean(week1_sleep[weekdays])
weekdays2_mean <- mean(week2_sleep[weekdays])

## Using the weekdays1_mean and weekdays2_mean variables,
## see if weekdays1_mean is greater than weekdays2_mean using the `>`
operator
weekdays1_mean > weekdays2_mean

## Determine how many days in week 1 had over 8 hours of sleep using the `>`
operator
week1_sleep > 8

## Create a matrix from the following three vectors
student01 <- c(100.0, 87.1)
student02 <- c(77.2, 88.9)
student03 <- c(66.3, 87.9)

students_combined <- c(student01, student02, student03)
grades <- matrix(students_combined, byrow = TRUE, nrow = 3)

## Add a new student row with `rbind()`
student04 <- c(95.2, 94.1)
grades <- rbind(grades, student04)

## Add a new assignment column with `cbind()`
assignment04 <- c(92.1, 84.3, 75.1, 97.8)
grades <- cbind(grades, assignment04)

## Add the following names to columns and rows using `rownames()` and
`colnames()`
assignments <- c("Assignment 1", "Assignment 2", "Assignment 3")
students <- c("Florinda Baird", "Jinny Foss", "Lou Purvis", "Nola Maloney")

rownames(grades) <- students
colnames(grades) <- assignments
```

```r
## Total points for each assignment using `colSums()`
colSums(grades)

## Total points for each student using `rowSums()`
rowSums(grades)

## Matrix with 10% and add it to grades
weighted_grades <- grades * 0.1 + grades

## Create a factor of book genres using the genres_vector
## Assign the factor vector to factor_genre_vector
genres_vector <- c("Fantasy", "Sci-Fi", "Sci-Fi", "Mystery", "Sci-Fi",
"Fantasy")
factor_genre_vector <- factor(genres_vector)

## Use the `summary()` function to print a summary of `factor_genre_vector`
summary(factor_genre_vector)

## Create ordered factor of book recommendations using the
recommendations_vector
## `no` is the lowest and `yes` is the highest
recommendations_vector <- c("neutral", "no", "no", "neutral", "yes")
factor_recommendations_vector <- factor(
  recommendations_vector,
  ordered = TRUE,
  levels = c("no", "neutral", "yes")
)

## Use the `summary()` function to print a summary of
`factor_recommendations_vector`
summary(factor_recommendations_vector)

## Using the built-in `mtcars` dataset, view the first few rows using the
`head()` function
head(mtcars)

## Using the built-in mtcars dataset, view the last few rows using the
`tail()` function
tail(mtcars)

## Create a dataframe called characters_df using the following information
from LOTR
name <- c("Aragon", "Bilbo", "Frodo", "Galadriel", "Sam", "Gandalf",
"Legolas", "Sauron", "Gollum")
race <- c("Men", "Hobbit", "Hobbit", "Elf", "Hobbit", "Maia", "Elf", "Maia",
"Hobbit")
in_fellowship <- c(TRUE, FALSE, TRUE, FALSE, TRUE, TRUE, TRUE, FALSE, FALSE)
ring_bearer <- c(FALSE, TRUE, TRUE, FALSE, TRUE, TRUE, FALSE, TRUE, TRUE)
age <- c(88, 129, 51, 7000, 36, 2019, 2931, 7052, 589)

characters_df <- data.frame(name, race, in_fellowship, ring_bearer, age)

## Sorting the characters_df by age using the order function and assign the
result to the sorted_characters_df
```

```
sorted_characters_df <- characters_df[order(age),]
## Use `head()` to output the first few rows of `sorted_characters_df`
head(sorted_characters_df)

## Select all of the ring bearers from the dataframe and assign it to
ringbearers_df
ringbearers_df <- characters_df[characters_df$ring_bearer == TRUE,]
## Use `head()` to output the first few rows of `ringbearers_df`
head(ringbearers_df)
```
